

IN THE CLAIMS

1. (Previously Presented) A method of improving cardiac function in a patient with heart failure without eliciting an immune response and without sacrificing the patient's skeletal muscle; which comprises the step of transplanting autologous bone marrow stroma cells (MSCs) into said patient's myocardium to grow new muscle fibers.

2. (Currently Amended) The method of claim 1, which further comprises the step of using a cell labeling technique to confirm survival and differentiation of implanted MSCs, and to identify said MSCs phenotype by both morphology and molecular markers.

3. (Previously Presented) The method of claim 1, which further comprises examining the effects of the micro-environment of implanted MSCs on their differentiation and phenotype expression.

4. (Previously Presented) The method of claim 1, which further comprises examining functional contribution of MSCs implanted into an ischemic segment of the myocardium.

5. (Previously Presented) The method of claim 1, wherein said transplanting is effected in the myocardium *in situ*, in the myocardium artery or using a catheter from within the myocardium.

6. (Previously Presented) The method of claim 1, wherein said transplanting is effected in association with angiogenesis factors.

8. Canceled

9. Canceled

10. Canceled

11. Canceled
12. Canceled
13. (Previously Presented) A method of treating cardiac failure, said method comprising:
  - (a) retrieving bone marrow from a patient suffering from cardiac failure;
  - (b) isolating marrow stroma cells from said bone marrow;
  - (c) expanding said marrow stroma cells in culture; and
  - (d) transplanting said marrow stroma cells into a myocardium of said patient.
14. (Previously Presented) The method of claim 13 wherein said step of retrieving bone marrow includes performing a bone marrow puncture.
15. (Previously Presented) The method of claim 13 wherein said step of transplanting said marrow stroma cells into the myocardium includes selective infusion of said cells into coronary circulation.
16. (Previously Presented) The method of claim 13 wherein said step of transplanting said marrow stroma cells into the myocardium is achieved by transvenous catheter injection.
17. (Previously Presented) Use of autologous marrow stroma cells for examining the effects of a myocardial micro-environment on marrow stroma cell differentiation, wherein said autologous marrow stem cells are introduced in situ into an ischemic segment of a myocardium of an animal model.
